

AgentFarm.Space

Concept framework for rapid agent building with AutoGen and N8n — design occurs in Rowboat.Space or Ideas.Space.

Overview

AgentFarm.Space is designed to enable users to quickly build their own agents in AutoGen or N8n. It is a concept framework — the actual agent conception and design take place in Rowboat.Space (business data & context) or Ideas.Space (creative ideation). AgentFarm provides the execution environment and orchestration layer. Currently, an Electron UI shell exists; the underlying technologies (Microsoft AutoGen, N8n) are implemented in other spaces.

Current Implementation Status

Component	Status	Location
Electron UI Shell	Implemented	<code>electron-app/agentfarm-manager.js</code> , <code>electron-app/agentfarm/</code>
React Dashboard	Implemented	<code>electron-app/agentfarm/dist/index.html</code>
ClawPort Dashboard Tab	Implemented	<code>electron-app/dashboard/src/features/AgentFarm.tsx</code>
ProjectProgress	Implemented	<code>electron-app/dashboard/src/features/ProjectProgress.tsx</code>
WorkflowBuilder	Implemented	<code>electron-app/dashboard/src/features/WorkflowBuilder.tsx</code>
Backend Agent	Not present	No entry in <code>python/swarm/backend_agents/__init__.py</code>
Python Space Directory	Not present	<code>python/spaces/autogen/</code> exists but is empty

ClawPort Dashboard Integration

AgentFarm has its own tab in the ClawPort React Dashboard with two sub-tabs:

Sub-Tab	Component	Purpose
AutoGen	<code>ProjectProgress.tsx</code>	Code generation progress from Coding Engine (6 stages: Analyzing → Complete)
N8n	<code>WorkflowBuilder.tsx</code>	N8n workflow management (status, list, enable/disable)

Where the Technologies Actually Live

Microsoft AutoGen

AutoGen is used in several other spaces, not centrally in AgentFarm:

- **Coding.Space:** [python/spaces/coding/Coding_engine/](#) — Extensive AutoGen usage for code generation
- **SWE Design:** [python/spaces/shuttles/swe_design/external/arch_team/](#) — AutoGen-based architecture validation
- **Ideas.Space:** [python/spaces/ideas/tools/autogen_research.py](#) — AutoGen for research tasks
- **N8n.Space:** [python/spaces/n8n/society/](#) — AutoGen Society for workflow generation

N8n Workflow Generation

N8n is implemented as a standalone space with 8 events:

- Backend Agent: [python/spaces/n8n/agents/n8n_agent.py](#) (8 events: generate, list, status, activate, deactivate, delete, execute, describe)
- 40+ workflow templates in [python/spaces/n8n/templates/](#)
- AutoGen Society in [python/spaces/n8n/society/](#) with 6 specialized agents:
 - [workflow_architect](#) — Workflow design
 - [n8n_docs_expert](#) — N8n API knowledge
 - [workflow_builder](#) — JSON generation
 - [workflow_tester](#) — Validation
 - [ux_agent](#) — User experience
 - [workflow_reviewer](#) — Quality assurance
- Orchestrated via AutoGen 0.4 [SocietyOfMindAgent](#) with [SelectorGroupChat](#)

Planned Features

- Centralized agent orchestration across all spaces
- Docker Toolkit for isolated agent environments
- MCP integration for standardized tool connectivity
- Custom tooling framework for domain-specific capabilities
- Agent marketplace for validated agent templates
- Monitoring and performance analytics

Roadmap

- Implement dedicated backend agent
- Centralize AutoGen usage from individual spaces into AgentFarm
- Complete custom tooling framework (Q2 2026)
- Cost optimization layer for agent execution
- Multi-agent orchestration for sequential and parallel tasks

Ecosystem Fit

AgentFarm.Space gives users the tools to quickly create their own agents. The concept is designed in Rowboat.Space (business context) or Ideas.Space (creative ideation) and then brought to AgentFarm for execution. It works closely with Desktop.Space (user activity triggers) and Coding.Space (custom implementations).
