

SecureClaw.Space

STATUS: PLANNED — No implementation in codebase.

Planned secure browser and messenger automation with extensible capability framework.

Current Status

SecureClaw does not currently exist as a standalone space. The currently available browser and messaging automation is handled via **Desktop.Space**:

- `openclaw.*` events are processed by the **DesktopAgent** (`python/spaces/desktop/agents/desktop_agent.py`)
- Clawdbot bridge for messaging interaction is part of the Desktop tools
- Browser automation runs via the Desktop automation UI and Moire tools

Planned Features

- Secure, validated browser control with user oversight mechanisms
- Messenger automation for chat applications
- Skill system for LLM-driven workflows
- Plugin architecture for external services (Google Drive, Slack, email)
- Security hardening with validation, isolation, and approval flows
- MCP support for standardized tool integration

Planned Technology

- OpenClaw as hardened foundation
- Browser control APIs with validation layers
- Plugin system for external service connectivity
- User approval flows and action validation

Ecosystem Fit

Once implemented, SecureClaw.Space will serve as Vibemind's bridge to external web and messaging platforms — with a dedicated security perimeter around all external interactions.
